Weekly Influenza Surveillance Report

Maryland Department of Health and Mental Hygiene | Infectious Disease and Environmental Health Administration
Office of Infectious Disease Epidemiology and Outbreak Response

SYNOPSIS

Influenza activity continued to be "widespread" in Maryland during the week of February 27 to March 5, 2011. Cases of influenza were reported throughout Maryland. The number and proportion of visits to sentinel providers and emergency departments for influenza-like illness remained elevated, but declines in some indicators continue to be observed. Seven outbreaks of respiratory disease were also reported. The State Laboratories Administration reported PCR-positive results on samples submitted for influenza testing during week 9, with both H1N1 and H3 comprising the biggest proportion of identified strains, with a continued increase in type B influenza.

PLEASE NOTE: Influenza is not a reportable condition in Maryland. As a result, we rely on select sources of information such as some (sentinel) clinical labs and physician offices, and the public. Because these sources cannot report all cases in the state, the counts contained in this summary do not represent the true number of cases of influenza in Maryland. They do provide valuable information about trends. All data are preliminary and subject to change.

INFLUENZA-LIKE ILLNESS SURVEILLANCE (ILINet)

During week 9, 10 sentinel providers reported 179 (2.4%) of 7,319 visits to their practices were for ILI. This is below the state baseline of 5.6%.

This same week last season, when influenza activity peaked late in October of 2009 and was on the decline by December, the proportion of visits for ILI was 2.7%.

For more information on the US Outpatient Influenza-like Illness Reporting Network (ILINet), please visit our website: http://dhmh.maryland.gov/fluwatch and click on "ILINet Sentinel Providers".

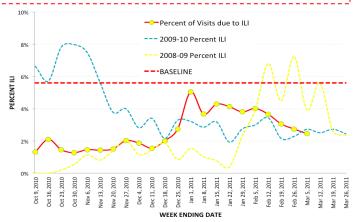

Figure 1. Proportion of visits for ILI to ILINet sentinel providers, 2010-11 influenza season

CLINICAL LAB REPORTS OF RAPID FLU TESTING

During week 9, 20 sentinel clinical laboratories reported 412 (13.8%) of 2,983 rapid influenza tests as positive: 313 were positive for type A, and 99 were positive for type B influenza. This proportion of positive tests was higher than the proportion reported at this time last season (2009-2010), which was 3.2%, and lower compared to the proportion observed during the peak of activity during the 2008-2009 season.

While not as accurate as PCR tests, rapid influenza tests become more accurate as the flu season progresses and as influenza becomes more prevalent in the community, giving insight into the activity of influenza.

MARYLAND RESIDENT INFLUENZA TRACKING SURVEY (MRITS)

During week 9, 593 (39.5% of total) participants in the MRITS responded to the weekly survey. Of those who responded, 16 (2.7%) reported flu-like illness. This proportion is slightly lower than this same week last season, when 3% of respondents reported flu-like illness.

We are always looking for more participants for the MRITS. If you know someone who would like to participate, please direct them to our website: http://dhmh.maryland.gov/flusurvey.

DHMH LABORATORIES ADMINISTRATION REPORTS

During week 9, the DHMH Laboratories Administration performed a total of 131 PCR tests for influenza. Ninety-two (92) were positive for influenza: 51 were type A (H1N1), 36 were type A (H3), and 5 were type B.

The table to the right shows the breakdown of positive tests by influenza strain for the 2010-11 influenza season to date.

More information on the valuable work done by the DHMH Laboratories Administration is available at http://dhmh.maryland.gov/labs.

EIP INFLUENZA HOSPITALIZATION SURVEILLANCE

During week 9, 55 hospitalizations associated with influenza were reported to the Emerging Infections Program (EIP) by 42 hospitals. To date, there have been 1,000 hospitalizations.

To be a confirmed hospitalization associated with influenza, the person must be hospitalized and have a positive influenza test of any kind (rapid test, PCR, culture).

During the same week last season, 4 hospitalizations were reported, with a total of 1,414 at that point in the season. For the entire season (2009-10), 1,458 hospitalizations were reported.

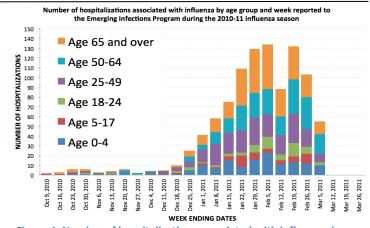

Figure 4. Number of hospitalizations associated with influenza, by age group and week, reported to the Emerging Infections Program, 2010-11 influenza season

DID YOU KNOW?

According to researchers from Mount Sinai School of Medicine, "Many healthcare professionals were exposed to the 2009 H1N1 influenza virus during the first wave of the pandemic because they were not using respiratory protection and/or other pieces of personal protective equipment (PPE)." (http://goo.gl/OtrkK) In fact, one of the questions we ask in flu surveillance is whether or not a flu case works in healthcare.

REPORTS OF OUTBREAKS IN INSTITUTIONAL SETTINGS

During week 9, seven outbreaks of respiratory illness were reported. Three were confirmed as influenza outbreaks, three were ILI outbreaks, and one was an outbreak of pneumonia. This brings the season's total to 62 reported outbreaks. Last season, a total of 208 outbreaks of respiratory illness were reported. Of those, 33 were confirmed as influenza outbreaks.

An outbreak of ILI is re-classified as an outbreak of influenza if there is laboratory evidence of influenza virus present in the samples collected from casepatients during the outbreak.

EMERGENCY DEPARTMENT ILI REPORTS (ESSENCE)

During week 9, a total of 44,096 visits to emergency departments for all reasons were reported to the Office of Preparedness and Response through the ESSENCE system. Of those visits, 1,106 (2.5%) were for influenza-like illness. This proportion is in between those observed over the prior two influenza seasons and slightly lower than the previous week.

For more information on ESSENCE, please visit the Office of Preparedness and Response's web site at: http://bioterrorism.dhmh.state.md.us.

GOOGLE FLU TRENDS

According to Google, influenza activity in Maryland is currently "MODERATE". What does this mean? From the Google Flu Trends Website: "We have found a close relationship between how many people search for flu-related topics and how many people actually have flu symptoms. Of course, not every person who searches for 'flu' is actually sick, but a pattern emerges when all the flu-related search queries are added together. We compared our query counts with traditional flu surveillance systems and found that many search queries tend to be popular exactly when flu season is happening. By counting how often we see these search queries, we can estimate how much flu is circulating in different countries and regions around the world."

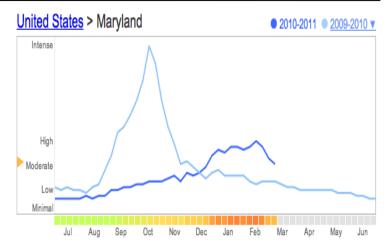

Figure 7 – According to Google Flu Trends, influenza activity in Maryland is currently "moderate". At this time last year, during the 2009 H1N1 influenza pandemic, influenza activity in Maryland was "low" to "moderate".

CDC NATIONAL INFLUENZA SURVEILLANCE REPORT

(http://cdc.gov/flu/weekly)

Synopsis: During week 9 (February 27-March 5, 2011), influenza activity in the United States decreased.

- Of the 7,556 specimens tested by U.S. World Health
 Organization (WHO) and National Respiratory and Enteric Virus
 Surveillance System (NREVSS) collaborating laboratories and
 reported to CDC/Influenza Division, 1,869 (24.7%) were positive
 for influenza.
- The proportion of deaths attributed to pneumonia and influenza (P&I) was above the epidemic threshold for the sixth consecutive week.
- Five influenza-associated pediatric deaths were reported bringing the season total to 60. Three of these deaths were associated with an influenza B virus and two were associated with an influenza A virus for which the subtype was not determined.
- The proportion of outpatient visits for influenza-like illness (ILI) was 3.1%, which is above the national baseline of 2.5%. Eight of the 10 regions (Regions 1, 2, 3, 4, 5, 7, 8 and 10) reported ILI at or above region-specific baseline levels. Ten states experienced high ILI activity; 12 states experienced moderate ILI activity; nine states experienced low ILI activity; 19 states and New York City experienced minimal ILI activity, and the District of Columbia had insufficient data.
- The geographic spread of influenza in 39 states was reported as widespread; nine states reported regional influenza activity; the District of Columbia and two states reported local influenza activity; Guam and the U.S. Virgin Islands reported sporadic influenza activity, and Puerto Rico did not report.
